---

**Exercise 1** (8 points) Consider a Black-Scholes market and a derivative contract with payoff at the maturity  $T$  given by

$$F(n, S_T) = 1_{n < S_T < n+1},$$

where  $1_A$  denotes the indicator function of the event  $A$ .

- i) Compute the price of the contract  $F(n, S_T)$  at any time  $t \in [0, T)$  and any  $n = 0, 1, 2, \dots$ . Compute the limit of the price for  $n \rightarrow \infty$ ;
- ii) Compute the Delta of the contract  $F(n, S_T)$  and the limit of the Delta for  $n \rightarrow \infty$ ;
- iii) Illustrate graphically the change of price and Delta of  $F(n, S_T)$  for an upward shift of the volatility;
- iv) Compute the price of the portfolio  $F$  given by

$$F(S_T) = \sum_{n=0}^{\infty} F(n, S_T);$$

- v) Compute the amount of Call options with strike price  $K = 1$  one has to buy/sell in order to get a Delta neutral (global) portfolio.

**Exercise 2** (6 points)

In the Black-Scholes model, find the price at time  $t \leq T$  of an UP-AND-IN contract where the owner receives the payoff

$$F(n, S_T) = 1_{n < S_T < n+1},$$

at the maturity  $T$  only if the asset has reached the upper barrier  $L > 0$ . Provide the price of the contract when  $n \rightarrow +\infty$ . Finally, find the Delta of the contract.

**Exercise 3** (10 points)

Solve for any  $n = 1, 2, \dots$  the following PDE for  $t \leq T$  :

$$\begin{aligned} \frac{\partial F}{\partial t} + x^2 \frac{\partial^2 F}{\partial x^2} + \frac{\partial^2 F}{\partial y^2} + x^n &= 0 \\ F(T, x, y) &= yx^2. \end{aligned}$$

**Exercise 4** (8 points)

Questions on the theory.

- i) State and prove the Second Fundamental theorem of asset pricing for a 2-periods finite-dimensional market model.
- ii) State and prove the SDE satisfied by a self-financing portfolio in continuous time
- iii) State and prove the (first version of the) Feynman-Kac formula
- iv) State and prove the PDE satisfied by the price of a European derivative in a Black-Scholes model.
